

STUDENT MATERIALS

PART 1 – LIVING LINEAR

Answer each of the questions below. Be sure to show your calculations in the space provided.

1. In a cafeteria a student purchases one of the lunch options for \$3.35 each day of the week. An equation to model this situation is $y = 3.35x$.

- I. If ten lunches are purchased, what is the total cost?

\$33.50

$$3.35(10)$$

- II. At the end of the month the total cost was \$67. How many school lunches were purchased?

20 lunches

$$\frac{67}{3.35} = 20$$

- III. In the equation $y = 3.35x$, the y -intercept represents

- (a) The total cost, in dollars, of buying a school lunch.
- b. The number of days school lunch was purchased.
- c. The total cost, in dollars, when zero lunches are purchased.
- d. The cost, in dollars, for one day of purchasing lunch.

- IV. In the equation $y = 3.35x$, the slope represents

- (a) The cost of buying a school lunch.
- b. The number of lunches purchased.
- c. The cost of purchasing additional food options.
- d. The total cost of purchasing lunches.

2. Sam earns \$50 per week by babysitting after school. If Sam babysits on the weekend an additional \$12 per hour could be earned. Sam is saving money to purchase a new outfit for the formal dance. To calculate money earned in one week the following equation can be used: $y = 12x + 50$.

I. The variable x represents:

How many hours she babysat

II. The variable y represents:

How much she gets paid a week for babysitting.

III. What does the slope represent in the context of the situation?

How much money she gets per hour

IV. What does the y -intercept represent in the context of the situation?

How much money she gets in total.

3. In a mathematics quiz bowl tournament, students compete to finish a math test in record time. Create equations to model the total time, in minutes, y , it will take each student to complete x questions, given the rates below.

Student A averaged 30 seconds per question.

Student B averaged .45 minutes per question.

Student C averaged $\frac{2}{3}$ minutes per question.

- I. Show your work and equation for each student below.

Student A:

$$y = .5x$$

Student B:

$$y = .45x$$

Student C:

$$y = \frac{2}{3}x$$

- II. If each student completes 40 questions, which student will win? C
- III. The student who won the mathematics quiz bowl finished in 26 minutes.
- IV. In the equation for Student A the slope represents:

How many seconds it took per question

- V. In the equation for Student B, the y-intercept represents:

The total time of completing the whole math test.

$$A = 20$$

$$B = 18$$
